

DemoTrack

Your silent manager.

Project Specification · v3.1 (final) · House & Tech House · Independent Artist Toolkit · Tunis, Tunisia · 2026

A career-management app for a solo house & tech-house producer with no team. It strips the friction out of getting your music to the right labels — turning demo submission from a thing you keep meaning to do into a **weekly habit that compounds**.

13	12	13	17	3
MODULES	DATA TABLES	BUILD PHASES	LABELS SEEDED	AI FEATURES

How to read this document. It explains, in plain terms, *what* DemoTrack is, *how* it works, the data behind it, the technology, and the order it gets built in. Every design choice traces back to one idea: a solo artist's bottleneck is **effort and consistency**, not talent — so the whole app is engineered to remove friction and manufacture momentum.

1. What it is & why it exists

DemoTrack is a personal command center for breaking through as an unknown producer. It does the job a manager would do for a signed artist — holding the accountability, the memory, and the workflow — because you don't have a manager.

The problem

Getting signed is mostly an outreach game: finding the right labels, sending demos the right way, following up at the right moment, and learning from every response. The work isn't intellectually hard — it's tedious, repetitive, and very easy to skip. The typical pattern: a producer sends a burst of demos once, hears nothing for a few weeks, gets discouraged, and the pipeline goes cold. No system, no memory, no momentum.

The core insight that shaped everything. The bottleneck isn't talent and usually isn't even contacts — it's effort and consistency. If sending a polished, tailored demo takes 3 minutes instead of 30, and the app proactively tells you who to follow up with today, you will actually do the work.

One-line pitch: "Find good labels, send great demos in minutes, never lose track of a follow-up, and learn from every reply — automatically."

The quality-over-quantity rule

Only labels that can genuinely change your trajectory belong in the system. A label clears the bar only if it meets **at least 3 of 5** tests: Beatport chart presence · booking impact · streaming credibility · scene respect · accessible to unknown artists. This filter is applied to every seeded label.

2. How it works — the core loop

Everything serves one repeating cycle. You run this loop for every track you want to place. The app makes each step faster and remembers the state, so nothing falls through the cracks.

The loop is the product. Modules are just the tools that make each step effortless.

3. The structure — four layers

Layer	What lives there	Purpose
 Music	Track Vault, Feedback Log	Your catalogue and its memory — what you're shopping and how it lands.
 Outreach the heart	Contacts CRM, Send Demo, Email Presets + AI Hook, Follow-up, A&R Intel, Label Discovery, (optional) Link Tracking	Where demos go out, get tracked, and get followed up.
 You	Artist Press Kit, Work Sessions, Goals	The solo-operator backbone — your EPK, accountability, and

targets.

Dashboard

Home screen + Notifications digest

Pulls signals from every module and answers "what should I do right now?"

Note on prioritization: there is **no weighted "contact score."** A computed score has a cold-start problem (almost no data early) and is false precision you'd never trust. Instead, each label simply shows a **"times contacted" count** (derived from your send history) and an **access path** (how reachable it realistically is). Untried, cold-demo-friendly labels surface first. Nothing to compute, nothing that breaks on day one.

4. The 13 modules in detail

Music Layer

01 • Track Vault

Your library of finished and in-progress tracks, each with a status: `idea` → `demo-ready` → `submitted` → `signed`.

- **Key fields:** title, genre tags, BPM, key, status, a private listen link + link type, notes, readiness checklist, exclusive-hold (which label is considering it, until when).
- **Audio is never hosted by the app** — you store a link (unlisted SoundCloud recommended, which also gives you free play counts). Keeps infrastructure light.
- **Why it matters:** the single source of truth for "what am I shopping right now." Every submission and every piece of feedback links back to a track here.

02 • Feedback Log

Captures every response a track gets — yes, no, "not for us," constructive notes, or silence — tied to the track and the contact.

- **Silence is data:** if a demo goes unanswered past the overdue window, the app **auto-logs a "no-response" record** — you type nothing.
- **Real replies** are logged in one tap from the follow-up queue (a response-type dropdown + optional pasted text).
- **Why it matters:** over time the AI reads across all your feedback and surfaces patterns ("your darker, peak-time tracks get more replies than your melodic ones"). That tells you what to make next and who to send it to.

Outreach Layer

03 • Contacts CRM

Every label and industry contact in one place, across 7 categories: Labels, DJs, A&Rs, Curators, Blogs, Promoters, Radio.

- **Key fields:** name, category, submission method, email/portal/DM link, relationship stage (`cold` → `engaged` → `responded` → `relationship`), access path, last contacted, full history, and a back-reference to the Discovery master it came from.
- **Why it matters:** knows who you've already contacted so you never double-send or forget someone. This is the backbone the entire outreach layer reads from.

04 · Send Demo

The submission flow and the most important screen in the app. Pick a track, pick a contact, choose a preset, the app auto-fills the email, you send — under 3 minutes.

- **Adapts to the method** (see Section 6): Email opens prefilled in your own inbox; Form opens the portal; DM opens the profile. You confirm so every send is logged with a status.
- **Pre-send checklist:** the target's submission requirements (file format, unreleased-only, single-not-album, etc.) render as a checklist, and the app **warns if the track is on exclusive hold elsewhere**.
- **Why it matters:** this is the friction-killer the whole product is built around. If this flow is fast and pleasant, you'll submit weekly.

05 · Email Presets + AI Hook

The email is **not** AI-written end-to-end. You keep your own preset templates; the app auto-fills everything mechanical, and AI suggests only the one personalized sentence that earns a reply. Detailed in Section 7.

06 · Follow-up Workflows

Automatically queues the right follow-up at the right time.

- **Timing:** 7-day silence nudge · 14-day overdue flag.
- **One-tap reply status:** because the app sends from your own inbox and can't read replies, the queue shows each open send with two taps — **"Got a reply"** or **"Still silent."** No nagging someone who already answered.
- **Why it matters:** following up is where demos actually get signed — and it's the single easiest thing to forget.

07 · A&R Intel

Research notes on each label — who runs it, what they sign, recent releases, submission preferences, and any personal angle. One record per contact. This is also what feeds the AI's personalized hook. Context turns a generic blast into informed outreach.

08 · Label Discovery

A browsable, filterable database of career-changing labels — separate from your personal CRM — so you always know your next target.

- **Filters:** genre, BPM range, submission method, tier, access path, last-verified date.
- **"Add to my CRM"** copies a label into your contacts with a link back to the master; if the master is re-verified, your copy is flagged "source updated — review."

- **Why it matters:** removes "who do I send to next?" as a blocker.

09 · Demo Link Tracking OPTIONAL · Phase 11

Wraps demo links so you can see when a label opens your demo. **Scoped to Form/DM links only — never email** (email open-tracking is unreliable and hurts deliverability). Lower priority because unlisted SoundCloud already gives you a real listen signal for free.

You Layer

10 · Artist Press Kit

A public EPK page at `press.demotrack.app/{your-slug}` with bio, links, releases, and stats — plus AI bio generation in 3 tones.

- **Stats are manual** with an "updated {date}" stamp (no fragile third-party integrations).
- **Served safely:** the public page is rendered through a narrow slug endpoint that returns only whitelisted fields — your private CRM and tracks can never leak.
- **Auto-attach toggle** adds the kit link to every demo by default.

11 · Work Sessions

Logs studio time — but kept to **hours + a one-tap mood** (fire / good / ok / low); "demos sent that day" is auto-filled. The gentle accountability a manager would otherwise provide, with almost no friction.

12 · Goals

Targets with live progress — e.g. "send 4 demos/month." **Progress is derived automatically** from your real activity (you only set the target). Turns vague ambition into measurable habits the dashboard can hold you to.

★ Dashboard

The home screen and connective tissue. Shows: demos to send, follow-ups due today, recently seen demos, goal progress, recent feedback, your work-session streak, and a **funnel** (sent → opened → replied → considering → signed) so you can see your real conversion and stay realistic.

5. The three AI features

Claude is used in three specific, high-leverage places — to remove the exact tasks that block a solo producer, not as a gimmick.

Feature	What it does	Guardrails
1. Email hook suggestion	Writes only the single tailored sentence ("why this track fits this label") that slots into your preset.	≤30 words; never fabricates a release/stat/angle; required; warns on duplicates.
2. Artist bio generation	Writes the press-kit bio in 3 selectable tones from your profile facts.	Facts only — no invented numbers or accolades.
3. Feedback pattern detection	Reads across your whole feedback log and surfaces which sounds/labels/approaches get the best response.	Needs a minimum number of responses before claiming a pattern; cites its evidence; counts silence.

Why AI here specifically. Each of these is a task that is boring, repeatable, and easy to put off — exactly the kind of work that stalls a solo artist. With email trimmed to just the hook, AI usage and cost stay tiny.

6. How outreach works

Three submission methods

Method	Badge	Flow
Email	 Green	Pick preset → app auto-fills merge fields → AI suggests the hook (you tweak) → opens your own Gmail / mail app, prefilled → you send → confirm logged. No in-app relay = no spam risk.
Form only	 Amber	App opens the portal/platform in a new tab → you submit manually → confirm in the app so it's logged.
DM only	 Blue	App opens the profile → you send the DM → confirm so it's tracked.

Prioritization — two honest signals, zero cold-start

- **Access path** — who's even worth a cold send. Discovery shows cold-demo-friendly first; relationship-only elites go to a separate "long game" list.

- **Times contacted** — a simple count per label. 0 = your next target; a high count with no reply = change the track or move on.

Default sort: cold-demo-friendly + untried first, then by tier. Stale labels get a freshness badge.

Follow-up timing & reply visibility

- **7 days silence** → gentle first-nudge queued.
- **14 days** → flagged overdue; a "no-response" feedback record auto-logged.
- The queue is driven by a send **status** you advance with one tap — never by reading your inbox.
- All of it is pushed to you in a **scheduled email digest**, not just parked in-app.

7. Email presets + AI hook — in detail

This is the most-used flow, so it's worth understanding fully. A preset is a **skeleton with merge fields** the app fills automatically, plus **exactly one slot you personalize**.

```
Subject: {genre} demo — "{track_title}" for {label}
```

```
Hi {first_name},
```

```
I'm {artist_name}, a house & tech house producer from Tunis. {hook}
```

```
"{track_title}" — {bpm} BPM, {key}. Private listen: {listen_link}
```

```
More on me: {press_kit_link}
```

Would love your thoughts. Thanks for listening.

{artist_name}

Everything in {...} auto-fills from the track, the contact, and your profile — **except {hook}**. AI proposes that one sentence (e.g. *"Your recent Cloonee EP on Hellbent is exactly the lane this track sits in"*); you confirm or tweak it, and the filled email opens in your own inbox to send. A send becomes: **pick track** → **pick label** → **confirm one sentence** → **send**.

Anti-mass-blast guardrail: the hook is required and the app warns if it's empty or identical to a recent send. Suggested starter presets: *cold email*, *DM* (shorter), *warm follow-up*, *form-portal note*.

8. Design principles (apply to every module)

The whole app exists to remove friction, so manual data entry is the enemy. These rules are non-negotiable:

1. **Derive, don't ask.** If a number can be computed from existing data, never make the user type it (times contacted, goal progress, demos-sent, the funnel are all computed).
2. **One-tap over typing.** Reply status, mood, send confirmation are single taps. Free text is reserved for the only three things a human must write: the **hook**, **A&R intel notes**, and **feedback text**.
3. **Silence is data.** An unanswered demo past the overdue window is logged automatically.
4. **Structural privacy.** Public data (the press kit) is exposed through a narrow whitelisted endpoint, not by trusting a permission rule to be perfect.

9. The data model — 12 tables

All data is stored in Supabase (PostgreSQL) with Row-Level Security, so every row is private to your account.

Table	Holds
contacts	Your personal CRM — every label/DJ/A&R/curator. Carries relationship stage, access path, and a back-reference to the Discovery master.

tracks	Your catalogue and each track's status, listen link + type, readiness checklist, and any exclusive hold.
submissions	Every demo sent (links a track to a contact); method, follow-up dates, and a status (sent → opened → replied → considering → signed → passed).
feedback	Every response, tied to a track and contact. Silence is auto-logged as a no-response record.
templates	Your preset email & follow-up skeletons with merge fields and one hook slot.
ar_intel	Research notes — one record per contact.
work_sessions	Studio time logs (hours + one-tap mood; demos-sent auto-filled).
goals	Your targets. Progress is a derived view, not a stored number.
link_events	Each click on a tracked Form/DM link (Phase 11, optional).
press_kit	Your public EPK profile — one row per user; served via a whitelisted slug endpoint.
labels	The curated discovery library (separate from your CRM): access path, genre tags, last-verified, sources, sub-label links, submission requirements.
notifications	Queued/sent reminders & digests, fired by a scheduler.

How they connect: your account owns everything. A contact has many submissions; each submission can have feedback (and, later, link events). A track has many submissions and feedback, and at most one active hold. The press kit is one-to-one with you. The labels library is read-only and seeds Discovery; labels you pursue become contacts. "Times contacted" is just a count of submissions — there is no scoring table.

10. The tech stack

A lean, modern stack chosen so one person can build and run it without a team.

Technology	Role & why
React 19 + Vite	The interface + a fast dev/build environment. Mobile-first, installable PWA (the habit happens on a phone).
Tailwind CSS 4	Styling system — consistent, quick, no CSS sprawl.
Vercel	Hosting/deploy for the app and the public press-kit pages; handles the subdomains.
Supabase (PostgreSQL)	Database + magic-link auth + Row-Level Security in one. 12 tables.
Supabase Storage	One bucket, for the press-kit photo only. Audio is never hosted.
Supabase pg_cron + Scheduled Edge Function	Fires the daily/weekly digest and the 7/14-day follow-up triggers.
Anthropic API (Claude)	Powers the 3 AI features. With email trimmed to the hook, usage and cost are tiny.
mailto: / Gmail compose deep link	Demo email opens prefilled in your own inbox — no relay, no send engine, no deliverability risk.
Edge Function (Deno)	The optional Phase-11 link-tracking redirect (Form/DM only) and the slug endpoint serving the public press kit.

Domains: `demotrack.app` (the app) · `press.demotrack.app` (public press kit) · `track.demotrack.app` (Phase-11 redirects, Form/DM links only).

11. The seed database — 17 curated labels

Loaded in Phase 3. Every one clears the quality bar. **Tier** reflects prestige; **access path** reflects how realistically reachable it is for an unknown — they are different axes.

Label & tier	Access path	Why it belongs
Drumcode · ELITE	relationship-only	Adam Beyer. Scene-defining — a long game, not a cold target.
Experts Only · ELITE	needs-warm-intro	John Summit. Peak of the scene.

Black Book · ELITE	needs-warm-intro	Chris Lake. A Beatport #1 machine.
Catch & Release · ELITE	needs-warm-intro	Fisher. Massive reach and chart dominance.
Repopulate Mars · A	cold-demo-friendly	Lee Foss. Where Mau P broke through. Open to demos.
Dirtybird · A	cold-demo-friendly	Claude VonStroke. Fun, quirky lane; launches careers.
Hellbent · A	cold-demo-friendly	Cloonee. Built for unknowns; charts constantly.
Three Six Zero · A	cold-demo-friendly	Dom Dolla. Open submissions; growing fast.
Hot Creations · A	needs-warm-intro	Jamie Jones. Deep scene credibility.
Solid Grooves · A	cold-demo-friendly	Michael Bibi. UK tech house institution.
Sola · A	cold-demo-friendly	Solardo. Consistent charting; email demos welcome.
Toolroom · B	cold-demo-friendly	Mark Knight. Solid distribution; long track record.
Defected · B	cold-demo-friendly	Huge catalogue; one send covers ~11 sub-labels.
Knee Deep In Sound · B	cold-demo-friendly	Hot Since 82. A less-competitive melodic lane.
Suara · B	cold-demo-friendly	Coyu. Darker tech house niche.
Club Sweat · B	cold-demo-friendly	Australian reach; good for emerging artists.
Space Yacht · B	open-window-only	Reviews demos live on Twitch — the most transparent route in the scene.

Access-path values are starting suggestions to verify during research — demo windows open and close.

12. Building the contact database — a parallel track

The database is the **fuel**; the app is the **engine**. Finding, verifying, and qualifying contacts that can actually change your career is a research workstream in its own right. It runs **alongside** the build, not after, and is never fully "done."

Research loop per contact: Source → Verify (2 independent sources) → Qualify (the $\geq 3/5$ bar) → Tier + access path + priority → Record (rules, links, sources, A&R note) → Maintain (stamp last-verified; Discovery flags stale entries).

What already exists: ≈ 170 verified labels and ≈ 98 non-label promotional contacts (radio, blogs, YouTube/Spotify curators, repost networks, podcasts, editorial, PR), with the 17-label in-app seed selected from them. **Ongoing:** migrate into the labels table, keep verifications fresh, capture sub-label efficiency multipliers (1 Defected ≈ 11 sub-labels; 1 Repopulate Mars ≈ 3), and add new qualified contacts as the scene moves.

13. The build plan — phases

Built in this order so the app is usable early and grows in value. Each phase is independently deployable. **By the end of Phase 4 you can send and record a real demo.**

Parallel track — runs throughout

Phase 0 · Contact Database Research (ongoing) — run the research loop; migrate the verified contacts into the labels table; keep verifications fresh.

MVP — reach your first real send

Phase	What you build	Done when...
1 · Foundation	Supabase project, 12-table schema, magic-link auth, Row-Level Security, React+Vite+Tailwind PWA shell, Vercel deploy.	You can log in, your data is secured and deployed.
2 · Track Vault	Add/edit/list tracks, status, external listen link + type, notes, readiness checklist, hold field.	You can store your tracks and see their status.
3 · Contacts CRM	Contact profiles across 7 categories, method + links, relationship stage, access path, seed the 17 labels, history view.	Your label list lives in the app with submission details.

4 · Send Demo	The submission flow — pick track + contact, choose preset, all 3 methods, pre-send checklist + hold warning, record to history.	You can send a demo and it's recorded. ← first usable milestone
5 · Email Presets + AI Hook	Preset CRUD with merge fields, auto-fill, Claude hook suggestion with guardrails, mailto/Gmail prefill.	A tailored, personal demo email in ~1 minute, from your own inbox.
6 · Follow-up + Digest	Preset follow-ups, 7/14-day rules via pg_cron, one-tap reply status, auto-logged silence, overdue queue, scheduled email digest.	The app tells you who to follow up — and reminds you when it's closed.

Intelligence — make every send smarter

Phase	What you build
7 · Feedback Log	One-tap reply logging, response types, auto no-response records, links back to track & contact.
8 · A&R Intel & Prioritization	Intel records per contact, "times contacted" on every label, untried + cold-demo-friendly sort. (No weighted score.)
9 · Dashboard + Funnel	Aggregate signals, the conversion funnel, response-rate by genre/tier, streak, CSV export.

Advanced — the unfair advantages

Phase	What you build
10 · Label Discovery	Browse/filter the labels master, "Add to my CRM" promotion, "have I submitted?" indicator, freshness warnings, sub-label reach hints.
11 · Demo Link Tracking optional	Edge Function redirect, unique hash, link events — Form/DM links only.
12 · Work Sessions & Goals	Sessions (hours + one-tap mood, demos auto-filled); goals with derived progress.
13 · Artist Press Kit	Profile fields, manual stats + updated stamp, public page via slug endpoint, AI bio (3 tones), auto-attach toggle.

14. What success looks like

The app only matters if it changes your behavior. These are the real measures — not vanity metrics:

- You submit demos **weekly**, not "whenever I get around to it."
- You **actually follow up** on demos you've sent (because the digest reaches you).
- You always know which labels you **haven't tried** yet.
- Sending a demo takes **under 3 minutes**.
- You get a response from at least one label **within 3 months** of consistent use.
- The longer-term target: **one signing within 6 months** of using it consistently.

A note on expectations. Cold-demo reply rates in this scene are realistically in the 5–15% range, and "we'll consider it" → an actual signing is a fraction of that. That is precisely why every send is engineered to cost 3 minutes: the math only closes when friction is near zero. The funnel view is built to read a quiet month as "keep going," not "this is broken."

15. The unfair advantages

- **AI woven into the loop** — the hook, bios, and feedback patterns remove the exact tasks that stall solo artists, at near-zero cost.
- **A curated, not exhaustive, label database** — only labels that can change your career, kept fresh, with honest access paths and submission rules built in.
- **Friction engineered out** — own-inbox sending, derived data, one-tap everything, and a reminder that reaches you. The app does the manager's remembering so you only have to do the music.
